

lozera — Company Background Brief

(Prepared for the Office of the Governor, Cebu Province)

About lozera

lozera is an AI infrastructure company that designs, builds, and operates **AI Factories**— high-density, high-performance computing facilities engineered specifically for artificial intelligence workloads. Our mission is to make AI deployment **faster, more capital efficient, and sustainable** by combining advanced hardware, renewable-energy optimized operations, and an integrated AI-as-a-Service layer that delivers measurable outcomes.

Core Capabilities

- **AI Infrastructure Design & Operation** – Development of AI-native data centers with optimized networking, cooling, and compute configurations.
- **IZEM Platform** – Proprietary “Zero Effort Modeling” system that dynamically routes AI workloads to regions with surplus renewable energy, reducing costs and environmental impact.
- **AI-as-a-Service (AlaaS)** – End-to-end AI deployment support, from model training and fine-tuning to inference hosting and performance monitoring.
- **Industry Solutions** – Customized AI solutions for healthcare, manufacturing, logistics, and other sectors.

Track Record & Partnerships

- **Global Hardware & Integration** – Working with Pegatron and Amax to deliver high density GPU systems, including NVIDIA HGX-class configurations.
- **Cooling Innovation** – Deploying ZutaCore’s direct-on-chip liquid cooling to enable sustainable, high-performance AI workloads.
- **Infrastructure Delivery** – Collaborating with NV5 and Schneider Electric to

design and build AI Factories to Tier 3+ standards.

- **Renewable Energy Alignment** – Partnering with utility-scale renewable providers to match AI workloads with surplus green power.
- **Global Project Footprint** – Active AI Factory developments in the U.S., Africa, and Southeast Asia, including the flagship Roark facility in Houston.

Commitment to Sustainability & Local Development

lozera's approach prioritizes local economic growth alongside global technology deployment. This includes:

- **Job Creation & Skills Training** – Partnering with universities and training programs to build a high-skill AI workforce.
- **Renewable Energy Integration** – Leveraging Cebu's growing renewable capacity for AI operations.
- **Regional Positioning** – Establishing Cebu as a Southeast Asian hub in lozera's global AI infrastructure network.

From Industrial Revolution to the Digital Revolution

The Industrial Revolution transformed the global economy by moving from manual production to mechanized manufacturing. Countries that embraced it created new industries, generated exports, and raised living standards. Today, the **Digital Revolution** is doing the same — but instead of producing steel, textiles, or automobiles, nations can now produce *digital products* for export: AI models, software, 3D designs, medical datasets, and other high-value digital assets.

Why the Philippines Needs to Lead in Digital Product Exports

For decades, the Philippines has been a leader in **BPO (Business Process Outsourcing)**, providing voice and back-office services to the world. However, automation and AI threaten millions of these jobs. The question is not *if* these jobs will change — but *how* the Philippines can transition its workforce into **AI-powered roles** that are more future-proof and higher paying.

Digital product exports offer that transition:

- **Zero physical shipping costs** — all exports travel instantly via the internet.
- **Unlimited scalability** — digital products can be sold to the U.S., EU, and other markets without additional factories or ports.
- **High value per employee** — digital exports often bring in *10–50x* more revenue per worker compared to traditional manufacturing.

Why Traditional Cloud Data Centers Don't Deliver the Same Economic

Impact Typical Cloud Data Center

- Purpose: Store and process data for global companies.
- Jobs: Mostly engineers and maintenance staff — *100–300 employees* for a multi billion peso facility.
- Output: *No direct product export*; revenue comes from renting computing power.
- Local economic multiplier: *Low* — most profit flows back to foreign HQ. **lozera AI**

Factory

- Purpose: Use data center infrastructure + on-site workforce to *create exportable AI products*.
- Jobs: *Thousands of skilled and semi-skilled workers* in AI training, data labeling, model refinement, and digital product packaging.
- Output: AI models, datasets, and software *sold directly to the U.S. and EU*.
- Local economic multiplier: *High* — wages stay in the local economy, building the middle class, stimulating retail, housing, and services.

Replacing and Expanding Jobs Lost in BPO

When AI automates call centers, it doesn't have to mean mass unemployment — it means *job evolution*:

- **From:** Answering customer queries.
 To: Training AI systems to answer those queries better.

- **From:** Manual data entry.
To: Annotating, verifying, and improving AI datasets.
- **From:** Scripted responses.
To: Developing AI-driven sales, marketing, and healthcare tools.

With the right training programs, an AI Factory can *upskill displaced BPO workers* in months, not years.

Economic Benefits for the Philippines

1. **Job Creation at Scale** – A 50MW AI Factory could employ *1,000–2,000 Filipinos* directly, plus thousands more in support services.
2. **High-Value Export Growth** – Each AI product can be licensed globally, bringing recurring export revenue without the limits of physical goods.
3. **Skills Transfer & Tech Leadership** – Workforce gains experience in AI — one of the fastest-growing industries worldwide.
4. **Tax Revenue & Local Business Growth** – Higher salaries mean more spending in housing, food, education, and retail.
5. **Resilience Against Global Shifts** – By diversifying beyond BPO, the Philippines safeguards its economy from automation shocks.

Summary Table — Data Center vs. AI Factory

Feature Typical Cloud Data Center **AI Factory**

Jobs 100–300 1,000–2,000

Product Export None AI models, datasets, digital tools **Economic Multiplier**

Low High

Local Skill Growth Minimal Significant

Revenue Source Compute rental Global AI product sales

Site and Infrastructure Requirements for an lozera AI Factory

To maximize the economic and employment impact of an AI Factory in the Philippines, the following site and infrastructure conditions are essential:

1. Land Requirement

- *15 hectares per 100 MW* of total planned AI computing capacity.
- Sufficient space to accommodate phased expansion, cooling infrastructure, logistics access, and workforce facilities.

2. Utility Access

- *Municipal Water Supply*
 - Reliable, high-capacity municipal water access for cooling systems and operational needs.
 - Supplemental capacity for potential hybrid cooling solutions and future efficiency upgrades.
- *Power Supply & Phased Ramp-Up*
 - **Phase 1 (Construction):** 2 MW required to support site preparation, initial systems, and construction operations.
 - **Phase 2 (Year 2.5):** 20 MW operational load for initial AI production capacity.
 - **Phase 3 (Post-Year 2.5):** Additional **20 MW increments every 6 months** until full 100 MW capacity is achieved.
 - This phased power delivery ensures infrastructure investment aligns with revenue and workforce scaling.

3. Workforce Pipeline & Education Access

- *Proximity to a University or Higher Education Center*
 - Direct recruitment channel for skilled graduates in computer science, engineering, design, and data sciences.
 - Opportunities for internship programs, AI training initiatives, and joint research collaborations with local institutions.

Strategic Benefit: By combining land availability, municipal water access, and a strong workforce pipeline, the Philippines can ensure an AI Factory achieves rapid deployment, sustained export output, and large-scale job creation. The phased power delivery model aligns capital expenditure with operational milestones, ensuring cost efficiency and minimal idle infrastructure.

Why This Matters Now

The global AI infrastructure market is entering its rapid build phase. Regions that align **compute, energy, and talent** early will define the next decade of innovation. Cebu can lead Southeast Asia in this transformation — and Iloilo's AI Factory model ensures that leadership translates into sustained jobs, high-value exports, and global competitiveness.
